NOVA Classification

“The most important factor now, when considering food, nutrition and public health, is not nutrients, and is not foods, so much as what is done to foodstuffs and the nutrients originally contained in them, before they are purchased and consumed. That is to say, the issue is food processing – or, to be more precise, the nature, extent and purpose of processing, and what happens to food and to us as a result of processing.”

Monteiro et al., Publ Hlth Nutr 2018;21:5-17

Processed Foods

Processes that modify food structure → Formulation → Unintentional Contaminants → Resource Management

NOVA Classification

- Group 1 – Processing used to preserve foods and to make them suitable for storage, facilitate their culinary preparation, enhance their nutritional quality, and often to make them more enjoyable to eat and easier to digest
- Group 2 – Processed culinary ingredients that are highly durable but usually not consumed by themselves.
- Group 3 – Ready-to-consume products; eaten by themselves or in combinations
- Group 4 – Typically formulated to be convenient, intensely palatable and highly profitable. They are formulations of industrial ingredients and substances derived from foods or else created in laboratories, and typically contain little or even no whole foods.

Koios et al., Intl J Hlth Policy Manag 2022;11:2588-2599

Three in four say they consider if food is processed, and six in ten try to avoid it

Those with higher incomes are more likely to consider whether food is processed.

Koios et al., Intl J Hlth Policy Manag 2022;11:2588-2599

Ideally, public health and clinical recommendations are based on the convergence of:

1. Epidemiological data,
2. Controlled clinical trial data,
3. Mechanistic data

Processed Foods

Epidemiology

Meta-Analysis of Observational Studies

Fig. 2 Forest plot of the association between ultra-processed food consumption and overweight using a random-effects model. Forest plot demonstrating meta-analysis of studies investigating the association between ultra-processed food consumption and overweight (ES and 95% CIs) using a random-effects model. ES, effect size; CI, confidence interval.

"Participants with higher intake of ultra-processed foods experienced two percent higher odds of excess body weight (pooled effect size 1.02; 95% CI 1.01 – 1.03), $p < 0.001$ "

Askari et al., Int J Obes 2020;44:2080-2091.

UPF Consumption and Weight Gain – EPIC Study (N=348,748)

Cordova et al., Clin Nutr 2021;40:5079-5088

Meta-Analysis of Observational Studies

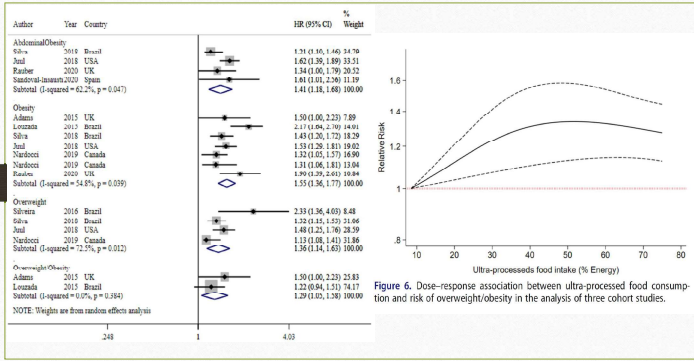

Figure 6. Dose-response association between ultra-processed food consumption and risk of overweight/obesity in the analysis of three cohort studies.

Moradi et al., Crit Rev in Food Sci Nutr <https://doi.org/10.1080/10408398.2021.1946005>

Risk of Cancer-Cardiometabolic Multimorbidity (N=266,666)

Cordova et al., The Lancet 2023 doi.org/10.1016/Janepa.2023.100771

UPF Consumption and Selected Health Risks (N=266,666)

Cordova et al., The Lancet 2023 doi.org/10.1016/Janepa.2023.100771

Magnitude of Effect

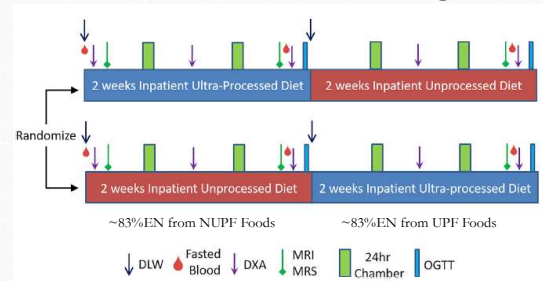

- Meta-analyses odds ratios – 1.02 – 1.55
- Comparable to estimates of:
 - Education
 - Economic status
 - Sleep duration
 - Anxiety
 - Physical activity
 - Television viewing

However

- Single components do not dictate overall impressions

What is your Favorite Color?

However

- Single components do not dictate overall impressions
- Liking does not grow monotonically

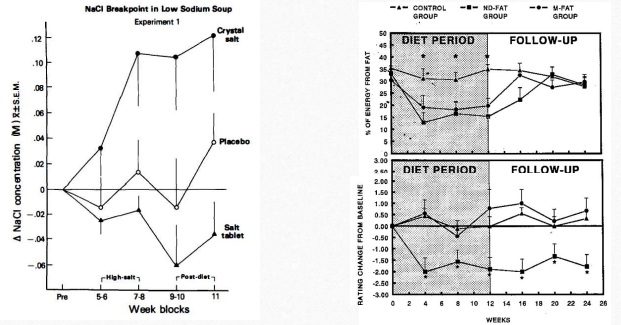

FIGURE 1. Individual hedonic responses from seven normal (a) and seven obese (b) subjects to sweetness in lemonade. Each point is the average of three judgments on a scale where 1 = dislike extremely, and 17 = like extremely.

However

- Single components do not dictate overall impressions
- Liking does not grow monotonically
- Preferred flavor principles vary widely cross-culturally
- Preferred sensory qualities change with age
- Hedonic impressions are driven by frequency of exposure

Kurt Lewin – We like what we eat more than we eat what we like

As their incomes rise, U.S. households spend more money on food but it represents a smaller share of their income. In 2022, households in the lowest income quintile spent an average of \$5,090 on food (representing 31.2 percent of income), while households in the highest income quintile spent an average of \$15,713 on food (representing 8.0 percent of income).

Ethical Issues

- Cost
- Convenience
- Diet Quality
- **Food Waste**
- Food Safety

Food waste:

Contributes ~8% of green house gasses
Contributes ~22% of solid waste in landfills
Accounts for ~21% of agricultural water (EPA)

Where our waste comes from:

Fruits and Vegetables
5 of top10 wasted foods
28% Consumers (NRDC)

~14.5% of Americans are food insecure or have very low food security

Ethical Issues

- Cost
- Convenience
- Diet Quality
- Food Waste
- **Food Safety**

Who is at highest risk for foodborne illness?

- **Infants and very young children,**
- **The elderly,**
- **Pregnant women and.**
- **Individuals with weakened immune systems**
(USDA)

But if remove preservatives and limit other methods to control foodborne pathogens

People with limited means who rely heavily on processed foods, will be at increased risk

Workshop

Supported by USDA, National Institute of Food and Agriculture
March 1-2, 2023

Hot Springs, Arkansas

Worksite	N
Academia	16
Government	10
Private Sector	6

- **Goal: Develop a Research Roadmap**
- **Focused on NOVA Food Classification System**

The 6 Research Questions were:

- 1) What objective methods or measures could further categorize UPFs, considering food processing, formulation, and the interaction of the two?
- 2) How can we improve exposure assessment of UPF intake?
- 3) Does UPF intake influence risk for obesity or CMDs, independent of diet quality?
- 4) What, if any, attributes of UPFs influence ingestive behavior and contribute to excess energy intake?
- 5) What, if any, attributes of UPFs contribute to clinically meaningful metabolic responses?
- 6) What, if any, external environmental factors lead people to consume high amounts of UPFs?
